Regionens Hus winner of Stora Glaspriset 2020!

Glas
priset
2020

The Swedish Glass confederation Gbf has chosen Regionens Hus for the most prestigious glass façade award. The innovative solutions and the slick design make it a worthy winner of the bi-annual award!

- White Arkitekter has designed a building built by Skanska with a unitized façade from UPB.
- The Xtreme 70/33 glass allows energy through the glass only as visible light, and lots of light, well over 60% light transmission even in TGU. Specifier Oskar Storm of Building Glass Polska sits in the window and see the light but feel very little heat.
- The Wictec 50 SG system from Wicona modified to stepped glass is ultraslim allowing the glass to cover 95% of the glazing area. The completely flat façade has total u-value close to 0,5.
- Glass plus shader has been calculated in the ESBO freeware from Equa Simulation to reach a g-tot of 0,17
- The combination of high performance glass together with internal shaders give the building the performance necessary for the highest classification of Miljöbyggnad Guld. Compulsory to reach this classification is low energy consumption for heating and cooling in combination with a high level of daylight. Regionens Hus found a new and very affordable way to this level of certification.
